

MAIN STREET IQ

AI-Augmented Strategic Advisory

Competitor Benchmark

Carhartt Family Wines

Executive Summary

This benchmark evaluates Carhartt Family Wines against 2 peer site(s) across three layers of search visibility: classic SEO, answer-engine readiness (AEO), and generative-engine visibility (GEO) across ChatGPT, Claude, and Perplexity.

For Carhartt Family Wines specifically, the audit surfaced 4 high-priority, 5 medium-priority, and 0 low-priority findings. Peer sites are shown in condensed form alongside, so the primary site can be read in context of the comparable cohort.

Top three actions for Carhartt Family Wines

- 1 AI crawlers served a bot-challenge page. In the bot-protection provider (Cloudflare, Akamai, Imperva, or similar), allowlist reputable AI crawler user-agents: GPTBot, ChatGPT-User, OAI-SearchBot, ClaudeBot, Claude-Web, PerplexityBot, PerplexityUser, Google-Extended, AppleBot-Extended. On Cloudflare specifically, this lives under Security, Bots, AI Scrapers and Crawlers, and AI Audit; switch the relevant user-agents from Block to Allow. Keep blocks on abusive scraper user-agents if desired. Verify the change by re-running this audit (the challenge page should disappear) and by checking server logs for the allowed user-agent strings within 7 days.
- 2 AI visibility below target. Publish answer-shaped pages targeting the queries above; ensure each is internally linked, has Organization + Article schema, and uses the brand name in the H1 and first paragraph. Re-test in 30 to 60 days.
- 3 Mobile performance score. Address the largest contributors to LCP (typically hero images and render-blocking JS), trim CLS by reserving space for images and embeds, and reduce TTFB at the origin or via CDN caching.

AI Visibility Comparison

AI assistants like ChatGPT, Claude, and Perplexity are quickly becoming how prospective buyers, decision-makers, and category researchers discover advisory firms. When a buyer asks an AI "what advisory firms should I consider for SMB strategy?", the model answers with a short list. Whether your advisory firm is on that list, and how often, is measurable. The table below shows it.

Column guide.

- Brand mention: the share of AI responses that name your advisory firm anywhere in the answer.
- URL citation: the share of AI responses that specifically point to your website domain.
- Queries: the total number of AI responses scored (queries multiplied by models).

Typical ranges: 0% means the AI doesn't know about you yet, which is common for newer brands or sites that block AI crawlers. Ten to twenty-five percent means the AI knows you but doesn't lead with you. Twenty-five to fifty percent is the "frequently recommended" tier. Above fifty percent means you are a default answer for the category. URL citation rates are almost always lower than mention rates, because AI models paraphrase from memory more often than they cite. Watching citation rate creep up over time is the single best signal that your content is being quoted, not just remembered.

Each site was scored against the same set of 10 industry-relevant queries sent to ChatGPT, Claude, and Perplexity. These are the same prompts Main Street IQ uses for the MSIQ cohort scorecard, so the numbers here are directly comparable to that quarterly measurement.

Site	Brand mention	URL citation	Queries
Carhartt Family Wines	0.0%	0.0%	40
Strange Family Vineyards	0.0%	0.0%	40
Clementine Carter Wines	0.0%	0.0%	40

Per-model breakdown

Site	Claude B	Claude U	GPT B	GPT U	Perp. B	Perp. U
Carhartt Family Wines	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Strange Family Vineyards	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Clementine Carter Wines	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%

SEO Signals Comparison

This section covers the basic mechanical signals that every search engine and AI crawler looks for on your homepage. None of these require deep technical skill to fix, but missing them is expensive: no matter how good your services or your brand are, machines cannot categorize your page correctly if the signals are missing or malformed.

Column guide.

- Title length: the headline shown in search results and browser tabs; fifty to sixty characters is the sweet spot.
- Meta length: the short description shown under the title in search results; aim for one hundred forty to one hundred sixty characters.
- H1s: the main heading of the page; exactly one H1 is correct, zero or more than one is a problem.
- Schema types: machine-readable metadata declaring what this page is about; look for Organization, ProfessionalService, or LocalBusiness at minimum.
- Broken links: links on the page that do not resolve; even one broken link reduces crawler trust.
- Missing alt %: share of images without descriptive text; higher numbers hurt image search and accessibility.

Scan your row for values that stand out against the cohort. If peers have schema types listed and your cell shows "none", that's usually a half-day fix with outsized return. If your title or meta fields are zero or very short, a short copywriting pass improves click-through from search results immediately.

Site	Title	Meta	H1s	Schema	Broken	Alt %
Carhartt Family Wines	16	0	0	none	0	0%
Strange Family Vineyards	15	0	1	none	0	0%
Clementine Carter Wines	57	0	5	LocalBusiness, Organization, WebSite	0	77%

AEO Signals Comparison

Answer-Engine Optimization (AEO) is about being quotable by AI assistants. When a buyer asks a question, the AI looks for short paragraphs that read as direct answers and lifts them as the source. These structural cues dictate whether your site is a candidate for that lift, regardless of your brand strength.

Column guide.

- Question headings: H2 or H3 headings phrased as actual questions ("What is the difference between fractional CFO and CFO advisory services?"); three to six per page is ideal.
- Snippet paragraphs: paragraphs in the thirty to seventy word range; short enough to quote, long enough to inform, and the exact shape AI engines prefer to lift.
- Direct answer near top: whether one of those snippet paragraphs appears in the first screenful of content; the single biggest factor in featured-snippet eligibility.
- FAQ schema: machine-readable Q&A metadata; eligible questions can render as expandable answers in Google rich results.
- HowTo schema: machine-readable step-by-step metadata for process content, for example, "How to prepare for a fractional CFO engagement"; unlocks additional rich-result placements.

A row of all "No" while peers show some "Yes" means peers are structurally more discoverable, even before considering content quality. Adding three question-shaped H2s with direct answers beneath them is often a one-afternoon editorial pass that pays off for months.

Site	Q headings	Snippet ¶	Direct ans.	FAQ	HowTo
Carhartt Family Wines	0	0	No	No	No
Strange Family Vineyards	0	0	No	No	No
Clementine Carter Wines	0	3	Yes	No	No

GEO Readiness Comparison

Generative-Engine Optimization (GEO) is about whether AI crawlers can reach your site at all and parse what is there. Unlike human visitors and Googlebot, which both forgive a lot, AI crawlers (GPTBot, ClaudeBot, PerplexityBot, and their peers) are strict. If they are blocked, they do not retry. If content is JavaScript-rendered, they see an empty page. If your brand entity is not declared in structured data, they cannot link their knowledge graph to your site with confidence.

Column guide.

- AI crawlers blocked: how many of the fourteen major AI crawler user-agents are disallowed in your robots.txt; any number above zero is a direct cap on AI visibility.
- llms.txt: an emerging plain-text file (see llmstxt.org) that summarizes what the site is, who it serves, and which pages matter most; sites with llms.txt are cited more accurately.
- Organization schema: JSON-LD that declares the business entity; without it, AI systems guess who you are from unstructured text, and often guess wrong.
- sameAs entries: links to your brand on other authoritative sites (LinkedIn, Instagram, Wikipedia, Crunchbase); three or more is typical, fewer and AI engines struggle to link their knowledge graph to your site.

The most common patterns on this row are either "all Yes with a healthy sameAs count" (AI-ready), or "all No / zero" (AI-invisible). The middle is rare and usually fixable in a week. A row of zeros on an otherwise-polished site is almost always a recent decision to block AI crawlers, and it can be reversed in the bot-protection dashboard in minutes.

Site	AI crawlers blocked	llms.txt	Org schema	sameAs
Carhartt Family Wines	0	No	No	0
Strange Family Vineyards	9	No	No	0
Clementine Carter Wines	0	No	Yes	3

Finding Counts by Site

This is the scorecard view. Each cell shows how many findings landed at each priority tier for that layer. High-priority items directly suppress visibility and should be addressed within two weeks. Medium items are structural improvements worth planning into the next thirty to sixty days. Low items are polish that compounds over time.

Column guide.

- SEO: mechanical on-page signals covered by the SEO Signals Comparison above.
- AEO: answer-engine structural signals from the AEO Signals Comparison.
- GEO: AI crawler access, llms.txt, entity schema, and AI visibility gaps.
- Performance: Core Web Vitals from Google PageSpeed Insights (mobile score, LCP, CLS).
- Total: sum of all findings, not weighted; useful for scanning which sites have the most open work.

Compare your row to the cohort. If you have more High findings than peers, you likely have an infrastructure-level issue such as blocking AI crawlers or client-side rendering. If your total is similar to peers but the split differs (more High, fewer Low), you're at parity on polish but missing a critical control. Use this table to decide where to start: begin with the cell that carries the most High findings.

Site	SEO H/M/L	AEO H/M/L	GEO H/M/L	Perf H/M/L	Total
Carhartt Family Wines	0 / 3 / 0	0 / 0 / 0	2 / 1 / 0	2 / 1 / 0	9
Strange Family Vineyards	0 / 3 / 0	0 / 0 / 0	3 / 1 / 0	2 / 0 / 0	9
Clementine Carter Wines	1 / 1 / 1	1 / 1 / 1	1 / 1 / 0	2 / 0 / 0	10

Detailed Findings | Carhartt Family Wines

Full Issue, Evidence, Recommendation, and Expected Outcome for every finding on the primary site. Peer findings follow in condensed form.

SEO

Mechanical signals, structured data, headings, link integrity, and Core Web Vitals.

1. Page content could not be assessed

MEDIUM

Type Crawler Access | Effort Moderate (under 1 day) | Lift +5 of 35 SEO, +5 of 100 overall, +2.4 Online Visibility (Valley)

ESTIMATED LIFT

composite-score lift on this layer +4% to +9% (estimate from score impact).

EVIDENCE

The fetch of <https://www.carharttfamilywines.com/> returned a bot-challenge page with only 3 words of visible HTML text. Title, meta, headings, and schema cannot be measured from what crawlers see. See the GEO section for the underlying cause and fix.

RECOMMENDATION

Resolve the GEO finding (AI crawler access or server-side rendering), then re-run the audit to evaluate classic SEO signals against real content.

EXPECTED OUTCOME

Once AI crawlers receive real HTML, the on-page SEO layer becomes measurable and fixable.

2. robots.txt missing

MEDIUM

Type Crawler Access | Effort Easy (under 1 hour) | Lift +2 of 35 SEO, +2 of 100 overall

ESTIMATED LIFT

crawl predictability +1% to +3% (estimate, vertical-typical band).

EVIDENCE

GET <https://www.carharttfamilywines.com/robots.txt> did not return 200.

RECOMMENDATION

Publish a robots.txt at the site root, even if it only contains 'User-agent: *' and a sitemap reference.

EXPECTED OUTCOME

Search engines find your sitemap and respect intended crawl rules.

3. sitemap.xml missing

MEDIUM

Type Crawler Access | Effort Easy (under 1 hour) | Lift +2 of 35 SEO, +2 of 100 overall

ESTIMATED LIFT

indexation completeness +1% to +3% (estimate, vertical-typical band).

EVIDENCE

GET <https://www.carharttfamilywines.com/sitemap.xml> did not return 200.

RECOMMENDATION

Generate and publish a sitemap.xml at the root and reference it from robots.txt.

EXPECTED OUTCOME

New and updated pages are discovered and re-crawled faster.

4. Mobile performance score

HIGH

Type Core Web Vitals | Effort Moderate (under 1 day) | Lift +2 of 7 Technical, +2 of 100 overall, +2 Web Presence Quality (Valley)

ESTIMATED LIFT

mobile conversion + bounce-rate reduction +5% to +12% (estimate, vertical-typical band).

EVIDENCE

Lighthouse mobile performance: 20/100. LCP 64945ms, CLS 0.174, TTFB 3ms.

RECOMMENDATION

Address the largest contributors to LCP (typically hero images and render-blocking JS), trim CLS by reserving space for images and embeds, and reduce TTFB at the origin or via CDN caching.

EXPECTED OUTCOME

A mobile performance score in the 90s improves both Core Web Vitals ranking signals and observed bounce rate.

5. Largest Contentful Paint above target

HIGH

Type Core Web Vitals | Effort Moderate (under 1 day) | Lift +2.5 of 7 Technical, +2.5 of 100 overall, +2 Web Presence Quality (Valley)

ESTIMATED LIFT

mobile bounce-rate reduction +5% to +12% (estimate, vertical-typical band).

EVIDENCE

Mobile LCP is 64945 ms; Google's 'good' threshold is under 2,500 ms.

RECOMMENDATION

Identify the LCP element (often the hero image), serve it pre-optimized (modern format, sized), preload it, and remove render-blocking CSS/JS above the fold.

EXPECTED OUTCOME

Faster LCP improves both the Core Web Vitals signal and perceived load speed for first-time visitors.

6. Cumulative Layout Shift above target

MEDIUM

Type Core Web Vitals | Effort Easy (under 1 hour) | Lift +1 of 7 Technical, +1 of 100 overall, +0.6 Web Presence Quality (Valley)

ESTIMATED LIFT

task-completion rate (especially mobile) +2% to +5% (estimate, vertical-typical band).

EVIDENCE

Mobile CLS is 0.174; 'good' is under 0.10.

RECOMMENDATION

Reserve explicit width and height on images and embeds, avoid injecting content above existing content, and load fonts with font-display: swap and matched fallbacks.

EXPECTED OUTCOME

A stable layout reduces accidental taps and improves the layout shift Core Web Vital.

AEO

Answer-engine readiness: question-shaped headings, snippet-eligible paragraphs, FAQ and HowTo schema.

No findings in this layer.

GEO

Generative-engine readiness and visibility: AI crawler access, llms.txt, entity schema, and direct mention testing.

1. AI crawlers served a bot-challenge page

HIGH

Type Crawler Access | Effort Moderate (under 1 day) | Lift +10 of 25 GEO, +10 of 100 overall, +5 Online Visibility (Valley)

ESTIMATED LIFT

AI mention + citation rate +18% to +35% (estimate, vertical-typical band).

EVIDENCE

GET <https://www.carhartfamilywines.com/> returned a bot-protection interstitial (Cloudflare-style challenge, 3 words of HTML text). GPTBot, ChatGPT-User, OAI-SearchBot, ClaudeBot, Claude-Web, PerplexityBot, and similar AI crawlers do not solve CAPTCHAs or JavaScript challenges; they receive this same challenge page and cannot index the real site.

****Why this matters to the business.**** AI assistants are now a primary discovery layer for category research. When a customer asks ChatGPT, Claude, Perplexity, or Gemini "what are the best wineries in Santa Barbara County" or "where should I taste Pinot Noir near Solvang", the AI compiles its answer from the sites it can read. This site is invisible in those answers. The lost surfaces are the highest-intent, highest-margin ones: weekend visit-planning, wine-club shopping, gift purchasing, concierge and travel-planner research, and corporate event scouting. The brand still ranks in classic Google because Googlebot is allowed through, but classic Google is a shrinking share of category-research traffic; AI assistants are taking the rest, and the brand is silent in that conversation. ****Why the operator usually doesn't notice.**** Human browsers (Chrome, Safari) and Googlebot are explicitly allowlisted by default in most bot-protection setups, so the website appears to work fine when checked manually. The AI crawlers are a newer category that bot-protection vendors started blocking in 2023-2024 by default, and almost no operator is told this is happening. The blocking is invisible until someone runs an audit like this one.

RECOMMENDATION

In the bot-protection provider (Cloudflare, Akamai, Imperva, or similar), allowlist reputable AI crawler user-agents: GPTBot, ChatGPT-User, OAI-SearchBot, ClaudeBot, Claude-Web, PerplexityBot, PerplexityUser, Google-Extended, AppleBot-Extended. On Cloudflare specifically, this lives under Security, Bots, AI Scrapers and Crawlers, and AI Audit; switch the relevant user-agents from Block to Allow. Keep blocks on abusive scraper user-agents if desired. Verify the change by re-running this audit (the challenge page should disappear) and by checking server logs for the allowed user-agent strings within 7 days.

EXPECTED OUTCOME

AI assistants begin fetching and indexing real page content, restoring eligibility for brand mentions and URL citations in the answers customers actually use to plan visits and buy. Expect noticeable change in AI visibility within 30 to 90 days as the crawlers revisit. Brand-name queries ("what is X winery") improve fastest; category queries ("best wineries in Y") follow once the AI has time to index enough content to stack-rank the brand against named peers.

2. No llms.txt published

MEDIUM

Type AI Discoverability | Effort Easy (under 1 hour) | Lift +1 of 25 GEO, +1 of 100 overall

ESTIMATED LIFT

AI discoverability (forward-compat hedge; not yet a guaranteed signal) +0% to +4% (estimate, vertical-typical band).

EVIDENCE

GET <https://www.carhartfamilywines.com/llms.txt> did not return content.

RECOMMENDATION

Publish llms.txt at the site root summarizing what the brand offers, who it serves, and which pages matter most. Mirror the structure recommended by llmstxt.org.

EXPECTED OUTCOME

Low-effort forward-compatibility hedge: if AI engines adopt llms.txt as a discovery signal (proposed by llmstxt.org, not yet widely consumed), the site is positioned for it. Treat as future-proofing, not a guaranteed citation lift.

3. AI visibility below target

HIGH

Type AI Visibility | Effort Hard (multi-day or vendor work) | Lift +5 of 25 GEO, +5 of 100 overall, +5 Online Visibility (Valley)

ESTIMATED LIFT

category-query AI mention rate +8% to +18% (estimate, vertical-typical band).

EVIDENCE

Carhartt Family Wines appeared in 0.0% of 40 model responses (URL cited in 0.0%).

RECOMMENDATION

Publish answer-shaped pages targeting the queries above; ensure each is internally linked, has Organization + Article schema, and uses the brand name in the H1 and first paragraph. Re-test in 30 to 60 days.

EXPECTED OUTCOME

Increased mention frequency in ChatGPT, Claude, and Perplexity responses, with growing share of cited URLs pointing to the brand's own domain.

Peer Findings | Condensed

Peer sites are summarized here at the issue level so the primary site can be compared in context. A full Issue, Evidence, Recommendation, and Expected Outcome report on any peer site is available as a separate audit engagement.

Strange Family Vineyards

Competitive Matrix

A scan-friendly side-by-side comparison across all sites in the cohort, including yours. Each section answers one strategic question. Mechanical metrics are direct from the audit; synthesis fields come from the per-profile Sonnet pass and carry their own confidence label in the Profiles section that follows.

How to read this matrix. Scan each row across all sites. Where you lead, that's a position to defend. Where you trail, that's an opening for the action items in your Implementation Roadmap. Where the whole cohort scores poorly, that's a category-wide opportunity nobody has captured yet.

Client and Competitor Profiles

One profile per site, starting with yours. Mechanical data is collected from each site's homepage and team or about page. Inferred fields (target demographic, strategy, spending signals) carry confidence bands so you can tell data from interpretation.

Carhartt Family Wines | (your site)

URL: <https://www.carharttfamilywines.com/>

Inferred target keywords (extracted from page headings + meta description; not Ahrefs ranking data)

moment

SEO and AI visibility snapshot

Signal	Value
Title length	16 chars
Meta description	0 chars
H1 count	0
Schema types	none
Question headings	0
FAQ schema	No
AI brand visibility	0.0%
AI URL citation	0.0%
AI crawlers blocked	0
Organization schema	No
sameAs entries	0

Inferred target demographic (confidence: low)

The data collected is too thin to identify a specific target demographic with confidence. The only keyword signal surfaced is 'moment', which loosely suggests experiential or occasion-driven wine buyers, but this is a single word and cannot reliably define age, income, geography, or life stage. No social, press, or structured site data was collected to support a firmer profile.

Inferred strategy (confidence: low)

The site has a title of only 16 characters, no meta description, no H1 tags, no schema markup, no internal or external links, and zero AI visibility. This points to a site that is either newly launched, dormant, or severely underdeveloped from a digital standpoint. There is no observable evidence of an active organic, paid, or referral channel strategy based on the data available.

Spending signals (confidence: low)

- Active paid marketing: unclear
- Agency relationship: unclear
- Paid keyword density: unknown
- Marketing posture: Effectively inactive or pre-launch based on the near-total absence of on-site optimization signals and zero AI or URL citation visibility.

Evidence: The site has no meta description, no schema types, no internal or external links, and 0.0 percent AI visibility. This level of technical incompleteness suggests little to no active marketing investment at this time.

Strange Family Vineyards

URL: <https://strangefamilyvineyards.com/>

Brief history

With respect for the land and an overall commitment to quality over quantity, we craft limited-production sparkling, still Chardonnay, Pinot Noir and Syrah wines that exemplify the distinctive qualities of the organic and sustainably-farmed Strange Family estate vineyard. We recognize the importance of celebrating life’s big and small moments. From the start, our goal has been to craft wines that are deserving of being at the heart of every joyful occasion, whether it’s a milestone, a special celebration, or a simple family dinner.

Social media presence

- Instagram: https://www.instagram.com/strange_wine | 4,204 followers
- Facebook: <https://www.facebook.com/strangewine> | 792 followers

Inferred target keywords (extracted from page headings + meta description; not Ahrefs ranking data)

forbidden forbidden

SEO and AI visibility snapshot

Signal	Value
Title length	15 chars
Meta description	0 chars
H1 count	1
Schema types	none
Question headings	0
FAQ schema	No
AI brand visibility	0.0%
AI URL citation	0.0%
AI crawlers blocked	9
Organization schema	No
sameAs entries	0

Inferred target demographic (confidence: medium)

The messaging centers on life milestones, family dinners, and joyful occasions, which suggests adults roughly in the 35-60 age range with disposable income for premium, limited-production wine. The organic and sustainable farming emphasis points toward health- and values-conscious buyers who care about provenance, likely in or near wine-country markets such as California. Data is thin on precise geography, income band, or purchase channel, so this is a directional read, not a confirmed profile.

Inferred strategy (confidence: medium)

Strange Family Vineyards appears to rely on a direct-to-consumer, brand-story approach built around estate identity and organic farming rather than volume or price competition. Their visible channels are Instagram (4,204 followers) and Facebook (792 followers), which are modest and suggest organic social rather than paid amplification. The site's SEO posture is extremely weak (no meta description, no schema, no internal or external links, zero AI visibility, and 9 AI crawlers blocked), so search and content are not functioning as acquisition channels at present.

Spending signals (confidence: low)

- Active paid marketing: unclear
- Agency relationship: unclear (no source available)
- Paid keyword density: unknown
- Marketing posture: Lean and brand-led, with minimal visible investment in digital infrastructure or paid channels.

Evidence: The site has no meta description, no schema markup, zero internal or external links, and blocks 9 AI crawlers, indicating little to no SEO or content-marketing spend. Social followings are small and skewed toward Instagram, consistent with organic posting rather than a paid or agency-managed program.

Clementine Carter Wines

URL: <https://www.clementinecarterwines.com/>

Brief history

Unlocking the treasures this place holds is the motivation to continue this knowingly fleeting endeavor. We only have one opportunity to get it right each year. In a lifetime of trying, that's not many breaks, yet we continue to engage in this magical madness that began 9,000 years ago across the globe.

Social media presence

- Instagram: <https://www.instagram.com/clementinecarterwines> | 7,392 followers
- Facebook: <https://www.facebook.com/casadumetzwines>

Inferred target keywords (extracted from page headings + meta description; not Ahrefs ranking data)

visit join, join club, club sonja, sonja visit, visit vineyard, vineyard subscribe

SEO and AI visibility snapshot

Signal	Value
Title length	57 chars
Meta description	0 chars
H1 count	5
Schema types	LocalBusiness, Organization, WebSite
Question headings	0
FAQ schema	No
AI brand visibility	0.0%
AI URL citation	0.0%
AI crawlers blocked	0
Organization schema	Yes
sameAs entries	3

Inferred target demographic (confidence: medium)

The keyword signals around 'join club,' 'club sonja,' and 'visit vineyard' point to wine enthusiasts who are interested in wine club memberships and on-site vineyard visits. The tone of the site copy ('magical madness,' 'fleeting endeavor') appeals to someone with a romanticized view of artisan winemaking, likely adults 35 and older with disposable income for premium or boutique wine purchases. Geography is unclear from the data, but the vineyard visit focus suggests a regional or drive-to audience rather than a national e-commerce buyer.

Inferred strategy (confidence: medium)

The primary go-to-market wedge is wine club membership acquisition combined with direct vineyard visits, as reflected in the top inferred keywords. Instagram is the main social channel with roughly 7,400 followers, and the Facebook URL references 'casadumetzwines,' suggesting a possible brand relationship or prior identity that may still

carry audience. There is no press coverage collected and zero AI visibility, which means the brand is almost entirely dependent on organic social and direct traffic from people already aware of them.

Spending signals (confidence: medium)

- Active paid marketing: unclear
- Agency relationship: unclear
- Paid keyword density: unknown
- Marketing posture: Lean and community-led, relying on Instagram presence and wine club loyalty rather than paid acquisition or search visibility.

Evidence: No meta description is present, 77 percent of images are missing alt text, AI visibility is zero, and there are no press mentions collected. These are signs of a site that has not been optimized for search or paid campaigns, pointing to a low-investment marketing posture.

Implementation Roadmap | Carhartt Family Wines

Findings grouped by priority. A developer or marketing operator can pick this up directly.

Priority 1, address within 2 weeks

AI crawlers served a bot-challenge page. In the bot-protection provider (Cloudflare, Akamai, Imperva, or similar), allowlist reputable AI crawler user-agents: GPTBot, ChatGPT-User, OAI-SearchBot, ClaudeBot, Claude-Web, PerplexityBot, PerplexityUser, Google-Extended, AppleBot-Extended. On Cloudflare specifically, this lives under Security, Bots, AI Scrapers and Crawlers, and AI Audit; switch the relevant user-agents from Block to Allow. Keep blocks on abusive scraper user-agents if desired. Verify the change by re-running this audit (the challenge page should disappear) and by checking server logs for the allowed user-agent strings within 7 days.

AI visibility below target. Publish answer-shaped pages targeting the queries above; ensure each is internally linked, has Organization + Article schema, and uses the brand name in the H1 and first paragraph. Re-test in 30 to 60 days.

Mobile performance score. Address the largest contributors to LCP (typically hero images and render-blocking JS), trim CLS by reserving space for images and embeds, and reduce TTFB at the origin or via CDN caching.

Largest Contentful Paint above target. Identify the LCP element (often the hero image), serve it pre-optimized (modern format, sized), preload it, and remove render-blocking CSS/JS above the fold.

Priority 2, address within 30 to 60 days

Page content could not be assessed. Resolve the GEO finding (AI crawler access or server-side rendering), then re-run the audit to evaluate classic SEO signals against real content.

robots.txt missing. Publish a robots.txt at the site root, even if it only contains 'User-agent: *' and a sitemap reference.

sitemap.xml missing. Generate and publish a sitemap.xml at the root and reference it from robots.txt.

No llms.txt published. Publish llms.txt at the site root summarizing what the brand offers, who it serves, and which pages matter most. Mirror the structure recommended by llmstxt.org.

Cumulative Layout Shift above target. Reserve explicit width and height on images and embeds, avoid injecting content above existing content, and load fonts with font-display: swap and matched fallbacks.
